Summary generation

Generating summary...
(The summary will be generated file by file, in alphabetical order. All generated text will use streaming. ~1.815 seconds to begin generating an output for the user compared to 10 seconds and potentially more, if given larger files, the field in which the summary is contained would be editable, also)

Current file: CMPS_4200_HCI_Phase_2_Project_Requirements.pdf

In Phase 2 of CMPS 4200 HCI: AI-Enhanced UI/UX, teams design the information architecture, user flows, and low-fidelity wireframes of their AI-powered application, with a strong focus on making AI interactions intuitive, trustworthy, and grounded in real model behavior. The phase begins with a kickoff and includes a technical spike—a small, working code test that measures latency, failure modes, and output quality when sending realistic inputs to the selected AI model—ensuring design decisions (like loading states, error handling, and user controls) are based on actual performance. Key deliverables include a site map and content strategy, primary and AI-specific user flows (with edge cases such as model unavailability or poor outputs), and low-fidelity wireframes that cover all AI states (empty, loading, success, low confidence, error) with clear annotations. The AI technical spike must document response times, failure behaviors, and cost, and may justify switching models if they are unsuitable. All components are due by the end of the week of October 5, culminating in a 10-minute team presentation with Q&A, where each member contributes and speaks.
